

Credit Card Performance & Insights

2023 portfolio dataset | Base and additional records | Source monetary units

Verified performance

Metric	Value
Matched customer records	10,293
Project revenue metric	56,517,010.81
Transaction amount	45,533,021
Interest earned	7,982,479.81
Transaction count	667,234
Mean satisfaction score	3.19

What the results support

Card mix: Blue cards contribute 47.19M, or 83.5% of the project revenue metric. Review concentration alongside per-customer values and costs before making product decisions.

Quarterly pattern: Q4 records the highest quarterly project revenue, 14.50M. The figures do not establish holiday effects or profit-margin changes.

Customer comparisons: Segment totals are useful for describing the customer base. Their differences do not establish lifetime value, retention risk or untapped market opportunity.

Definitions and limits

Project revenue = transaction amount + annual fees + interest earned. This composite reproduces the project metric; it is not recognised bank revenue or profit. CSV rows are client-level snapshot records with aggregated transaction counts, not individual purchases.

The CSVs do not identify currency, so neither pound nor dollar symbols are used. Satisfaction values range from 1 to 5, but response labels and benchmarks are not documented. The observed mean cannot establish dissatisfaction or churn.

Source: credit_card.csv + cc_add.csv and customer.csv + cust_add.csv. Update count headers are aligned before appending. Client_Num is unique on each side and the join is validated one-to-one. See rebuild_preview.py and summary CSVs for calculations.
